

# POLYACRYLIC

## INFORMATION ON THE MATERIAL

### **MATERIAL**

100 % spun dyed polyacrylic with 280g/m<sup>2</sup>.

### **PROPERTIES**

The artificial fiber similar to wool is 100 % suitable for outdoor use and stands out by its ability to only absorb very little moisture, to convey this very quickly and to dry rapidly. In addition, our textiles made of polyacrylic are coated with Teflon. This makes them resistant to stains and mold formation and rainwater runs off the surface.

The true strength of this material is above all its light fastness of 7–8. Polyacrylic is easy to process and thus generates first-class results for pleasant sitting and reclining comfort.

### **CARE AND STORAGE**

To ensure a long product life, please clean the fabric regularly with a damp cloth. We recommend using our STERN Outdoorfabric Detergent to remove heavier soiling. In this context it is important to mention that heavy soiling should be treated immediately. Dried, encrusted and sticky stains should be softened a little before cleaning. Please never rub the fabric. After cleaning, let the product air dry in a well shaded area.

You can wash cushions coverings with zips in the washing machine using the gentle action program at maximum 30 °C with a mild washing powder without any problem. Afterwards pull over the filling while still damp and leave the cushion to dry propped up in the shade.

We do not advise drying in tumble dryers, as this will damage the fibers.

To maintain the dirt and water-repellent characteristics, we recommend using our STERN Outdoorfabric Protector.

For you to be able to enjoy your upholstery for a long time, we recommend storing the cushions indoors in case of prolonged rain and during the winter months or covering the group of seats with a STERN protective cover. You can obtain these in different sizes at your specialist shop.
